Acrylic on Canvas — 30" x 42" — 2011

An Abstract Winter

Acrylic on Paper — 12" x 18" — 2021

An Abstract Fall

Acrylic on Paper — 12" x 18" — 2021

Guernica Re-Imagined

India Ink on Paper & Electronics — 12' x 5' — 2011

Pablo Picasso's Guernica (1937), inspired by the bombing of Guernica during the Spanish Civil War, depicts the horrors of war and human suffering through distorted figures and abstract forms. This 12 foot work reimagines this iconic painting in a contemporary context, exploring how computer technology has transformed warfare by extending its destructive reach through electronic/digital means. By incorporating computer components such as keyboards, microchips, and wires into a recreation of Guernica, I sought to reflect the physical and psychological harm caused by technology-driven warfare while preserving the original painting's powerful statement against violence.

Color Relativity

Steel Frame, Stretched Canvas & Acrylic Paint

6' x 4' x 1.5' — 2010

This three-dimensional artwork explores Josef Albers' color theory, particularly the way in which the perception of a single color can change through its juxtaposition with different surrounding colors. Constructed using a steel frame covered with stretched canvas, the work features two identical blue circular forms positioned against four contrasting background colors. Although the central circles share the same color, their surrounding colors create the optical illusion of two different shades of blue. Through this experiment, the work demonstrates the relativity of color perception and how the visual experience of color is influenced by its surrounding environment.

The Jester

FRONT & BACK

Wax & Gesso — 5" x 7" x 4" — 2010

This sculptural work, titled ‘The Jester’, was initially created entirely from wax, which served as the original model for the casting process. A sand mold was then produced from the wax sculpture, and molten aluminum was poured into the mold to recreate the original form. Through this process of sand casting, the sculpture was transformed from a temporary wax model into a permanent aluminum object.

Pacemaker

Fired Ceramic with Multiple Glazes

2' x 1.5' x 1' — 2010

This ceramic sculpture is a three-dimensional representation of the human heart, created using clay and finished with multiple glazes. Through this work, I wanted to explore how people would react to encountering a familiar object that exists within all of us but which we do not normally get to see in person. By recreating the heart in sculptural form, I wanted to make something normally hidden within the human body physically visible and accessible in plain sight.

Flow

Fabricated Steel Sheets — 4' x 5' x 7' — 2011

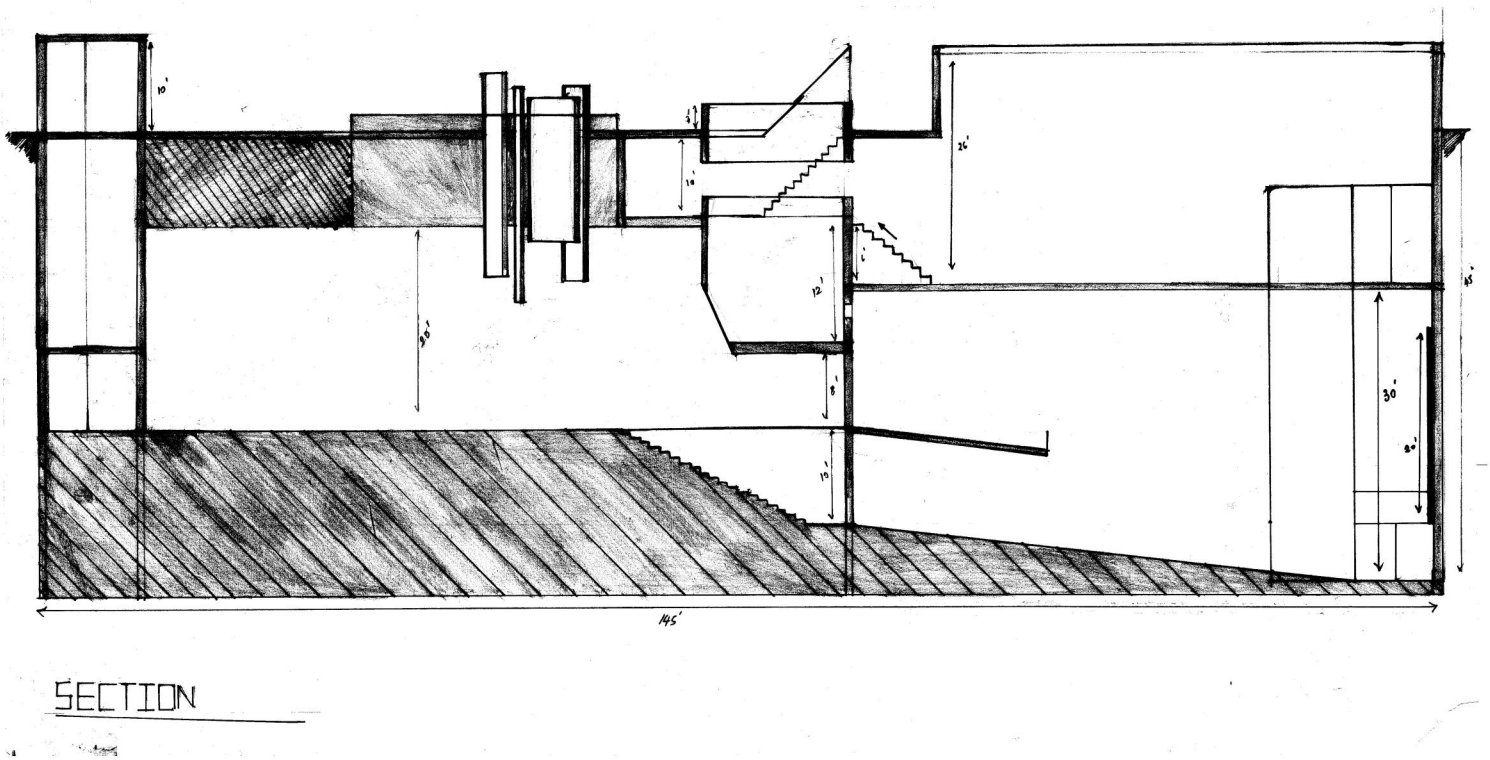

'Flow' is a site-specific sculptural installation created at an abandoned wheat-processing barn. Inspired by the barn's former loading process, where wheat was transferred into transport vehicles through loading docks, I used steel sheets to create an abstract sculptural representation of wheat flowing downward from the loading docks. Through this work, I sought to reinterpret the site's former industrial function and history through sculptural form.

Cinema Invisible

ARCHITECTURAL DRAWING — SECTION

Pencil on Architectural Vellum — 2009

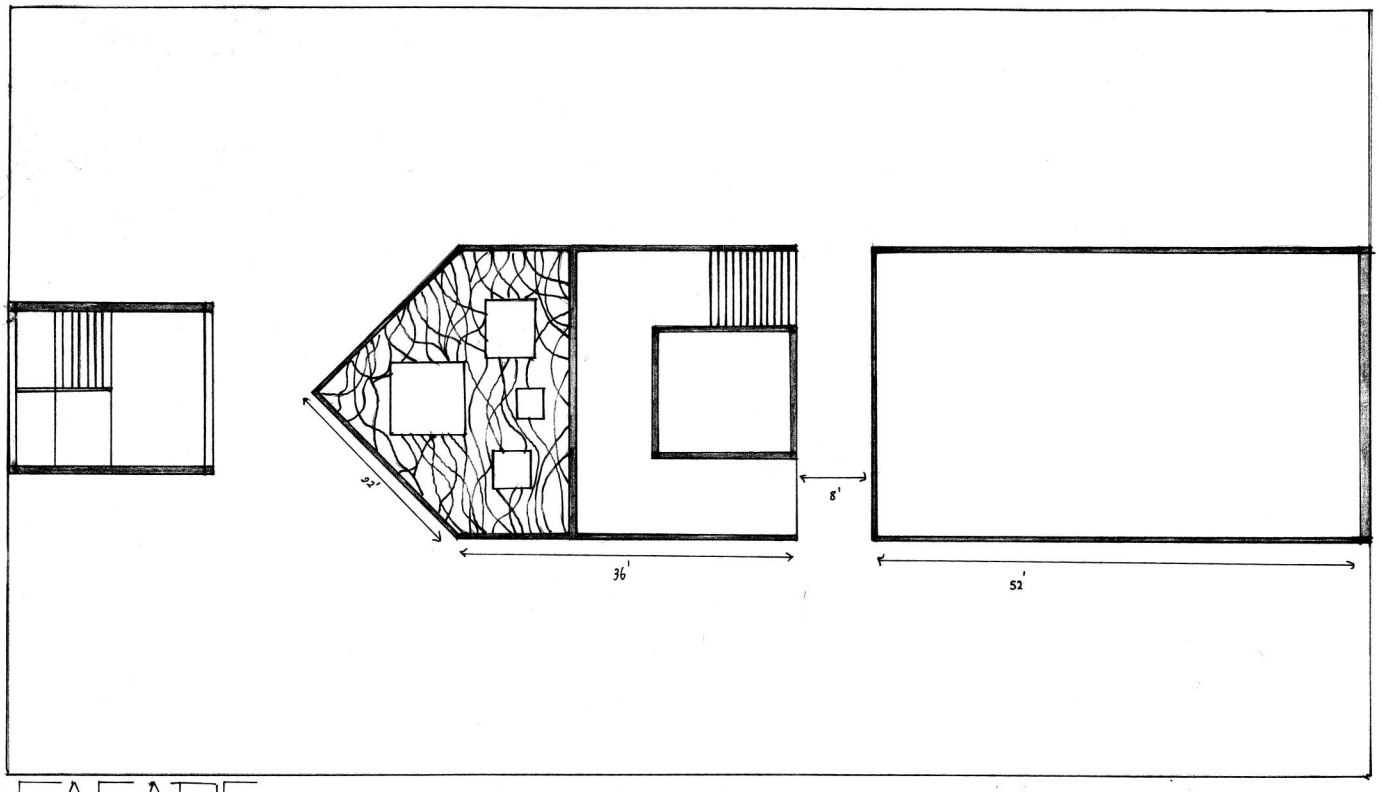

'Cinema Invisible' is an architectural concept that explores the experience of watching a film as a transition from the physical world into another reality. The structure is based on a punctured cube, designed to allow small amounts of natural light to enter its interior. The entire cinema is situated 40 feet underground, creating a sense of separation from the outside world. Light shafts positioned within a fountain above ground allow natural light to filter into the underground entrance passageway, creating a natural chandelier effect. Through this design, I sought to create an immersive architectural experience that reflects the psychological transition of entering a cinema and becoming absorbed in the world of film.
